

A2W-Macro

Long strings can overflow stack

Location			
Description	<p>A2W macros can lead to stack overflows or unhandled exceptions.</p> <p>The Microsoft Active Template Library (ATL) is a set of template-based C++ classes that simplify the programming of Component Object Model (COM) objects. It provides the A2W set of macros for converting between ASCII and wide (Unicode) characters.</p> <p>The A2W macros call _alloca(), which allocates memory from the stack. If the input string is too long, so that the stack would overflow, _alloca() will throw an exception. If the exception is not caught, the program will halt.</p>		
APIs	FunctionName		Comments
	A2W		
	CW2CT		
	W2A		
Method of Attack	An attacker can provide very long strings of input to vulnerable methods potentially gobbling up all the stack space. If the appropriate exceptions are not caught, the program will halt causing a DoS.		
Exception Criteria			
Solutions	Solution Applicability	Solution Description	Solution Efficacy

	<p>Whenever A2W macros are used.</p>	<p>Avoid use of these methods.</p> <p>New conversion macros were introduced in ATL 7.0. These macros, which have somewhat different usage, are more robust and do not allocate memory on the stack. Use these instead of the older A2W macros.</p> <p>If you can't use the ATL 7.0 conversion macros, always wrap the conversion with an exception handler. Reset the stack if stack overflow exceptions occur.</p> <p>MSDN advises "Check the length of the strings before passing them to these macros to avoid potential buffer overrun problems. Stack overflows are exceptions that could also be caught with try/except." The length of string that would be problematic depends on how the /STACKSIZE linker option is used. It is not clear how</p>	<p>Believed to be effective.</p>
--	--------------------------------------	---	----------------------------------

	<p>stack overflows would occur for these macros. Possibly this recommendation refers only to the older macros.</p> <p>Check the input length before using any of these macros to ensure that lengths are not dangerously large</p>
Signature Details	Presence of any of the A2W macros identified above.
Examples of Incorrect Code	<pre>// Note use of older macro that // allocates stack memory. // Does conversion, but could // overflow stack and throw exception LPCTSTR szr = A2T(szReplaceFile);</pre>
Examples of Corrected Code	<pre>// Use new macro // Note form of code above // doesn't work for new macros if (strlen(szReplaceFile) > MAX_REASONABLE_SIZE) { /* handle error */ } else {CA2TEX szr(szReplaceFile);}</pre> <pre>// If must use older macro, catch // exception and reset stack if (strlen(szReplaceFile) > MAX_REASONABLE_SIZE) { /* handle error */ } __try { LPCTSTR szr = A2T(szReplaceFile); // use szr } __except ((EXCEPTION_STACK_OVERFLOW == GetExceptionCode()) ? EXCEPTION_EXECUTE_HANDLER : EXCEPTION_CONTINUE_SEARCH) { _resetstkoflw(); }</pre>
